Context

IMSS

Mexico's largest public healthcare system.

Key Actors

Patient

Receives medication at home after enrolling through IMSS.

Route Coordinator

Plans delivery routes and assigns them to operators.

Last-Mile Operator

Delivers medication directly to patients and fills out a physical report for IMSS.

Why this project mattered

The Problem & The Goals

The problem

- Manual, paper-based workflows
- Missed or delayed deliveries
- No visibility for logistics teams
- Disconnected supply chain actors

Our goals

- Digitize the full delivery workflow
- Enable real-time tracking and reporting
- Reduce friction for operators
- Improve data accuracy across systems

Case study

The design process

Understanding

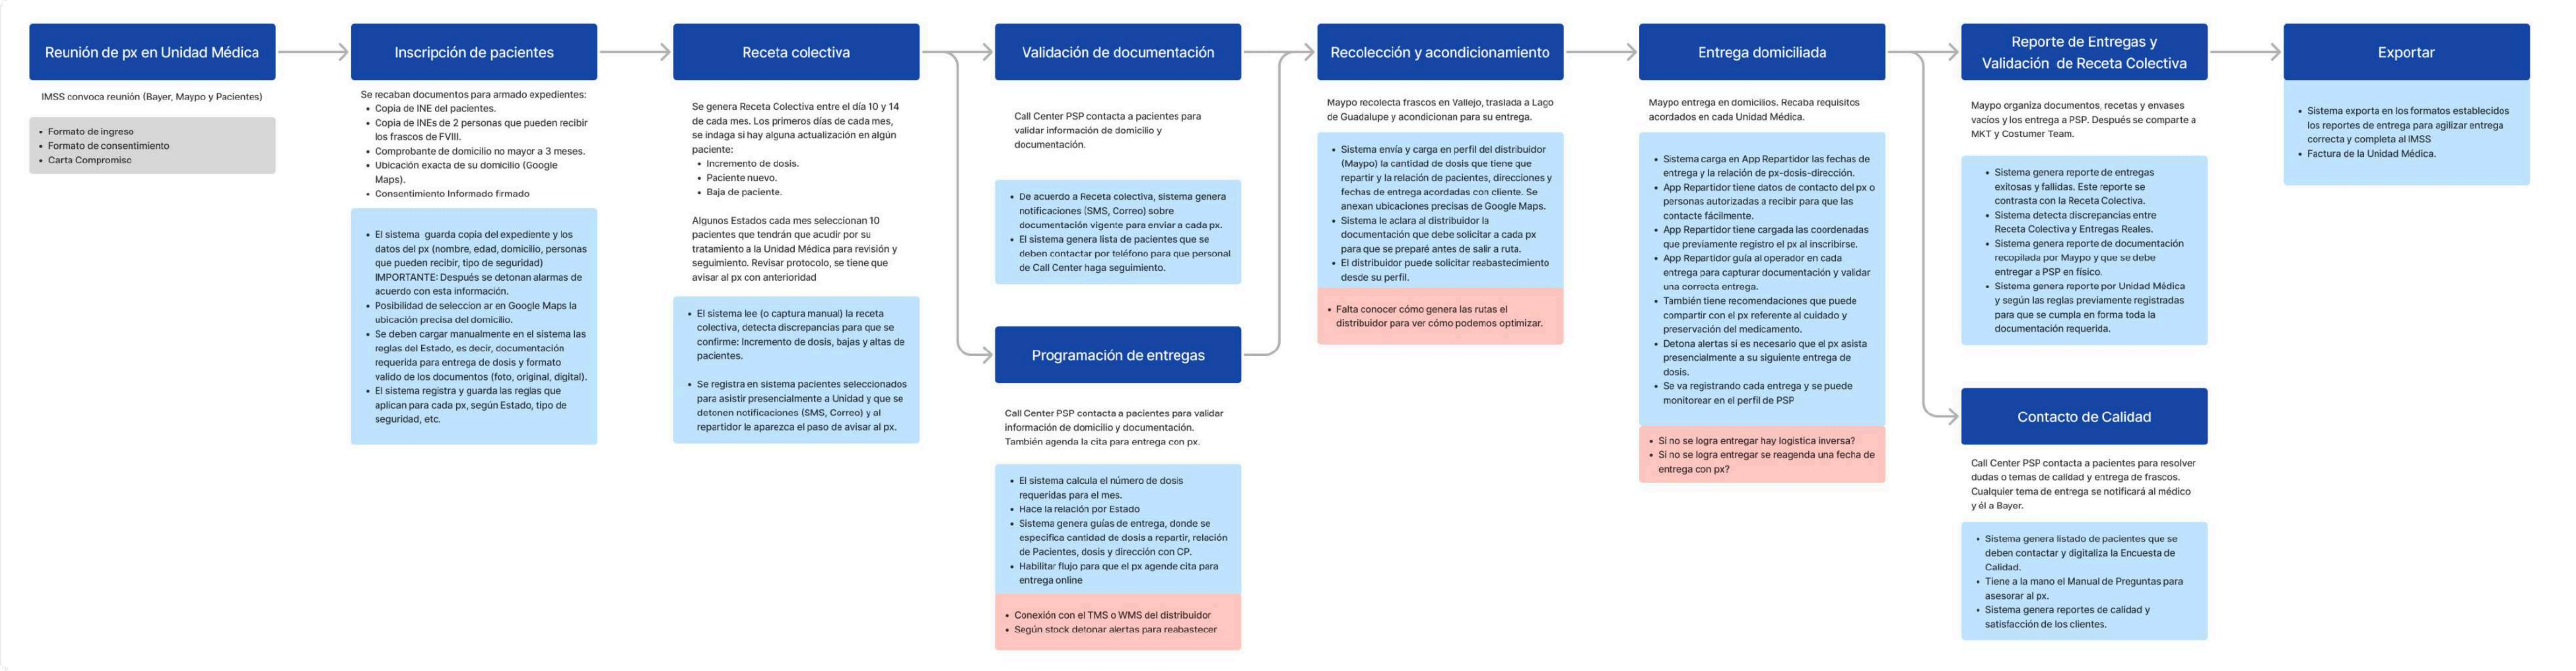
Understanding the Real Process

To design the right solution, we first had to understand how things actually worked: the steps, the people, and the tools involved.

What we did

- Mapped the full delivery process
- Identified roles and touchpoints
- Documented system constraints
- Built the discovery map

Foundational discovery map



Understand

What We Learned from the Field

01 Lack of Standardization

Each clinic managed documentation differently, making oversight difficult.

02 Heavy Reliance on Manual Processes

Paper-based tracking led to errors and lost information.

03 Low Traceability

No real-time visibility or centralized delivery records.

04 High Cognitive Load for Operators

Drivers had to memorize each delivery step and rely on phone calls for clarification.

Understand

Connecting What People Say with What Really Happens

We combined stakeholder interviews and field research to build a complete view of the actual delivery workflow, going beyond what was documented on paper

Define & Ideate

Who We're Designing For

Route Coordinator

Javier Mendoza

Route Coordinator

45 years old

Tech comfort level:

Moderate to advanced – experienced with spreadsheets, route planning software, and geolocation systems; open to learning new platforms.

As a **route coordinator**, I need to plan and monitor deliveries efficiently so that I can reduce delays, assign the right drivers, and solve issues without disrupting operations.

Frustrations:

- Limited visibility over delivery progress
- Repeated manual work outside the system
- Delays in receiving prescription data
- Trouble reassigning routes on short notice

Behaviors:

- Manages logistics and team assignments
- Uses spreadsheets, GPS, and software tools
- Thinks strategically but adapts quickly when needed

Needs:

- Central platform to manage and monitor all deliveries
- Real-time alerts for delays or issues
- Easy way to update or reassign routes

Last-mile operator

Luis Pérez

Last-mile operator

30 years old

Tech comfort level:

Basic to moderate – familiar with smartphones and apps like Google Maps or Waze; comfortable following digital instructions.

As a **delivery operator**, I need to complete each delivery accurately and on time, so that I can stay productive without getting calls or complaints from patients or supervisors.

Frustrations:

- Incomplete or unclear delivery addresses
- Uncertainty about the steps required per delivery
- Poor communication with the coordination team
- Lack of clarity when handling sensitive patient documents

Behaviors:

- Follows clear, step-by-step instructions
- Relies heavily on GPS and mobile apps
- Prefers fast, efficient task completion

Needs:

- Clear delivery checklist and guidance
- Access to patient and delivery info via mobile
- Fast support in case of issues

Define & Ideate

Who We’re Designing For

To align on a realistic MVP, we used MoSCoW prioritization to balance user needs, business value, and technical feasibility.

MoSCoW matrix

Must Have

- Bulk upload and validation of prescriptions per patient
- Operator assignment to delivery routes
- Real-time visibility into deliveries and route status
- Access to patient documentation to validate delivery
- Operator status tracking: started, in progress, completed
- Coordinator dashboard (delivery status and operator activity)
- Proof of delivery record (form, photo, or signature)

Should Have

- Option to bulk or individually download files
- Patient documentation download
- FAQ glossary for operators

Could Have

- Contact encryption
- Educational content for patients
- Confirmation of delivered vs. expected dosage
- Same-day delivery confirmation to the coordinator

Won´t Have

- Patient assignment to distributors based on business rules
- Operator geolocation
- Offline mode
- Distributor management dashboard

THIS PRIORITIZATION GUIDED THE PRODUCT SCOPE FOR THE FIRST RELEASE.

Define & Ideate

Turning Needs into Actionable Flows

Why we mapped the MVP flow:

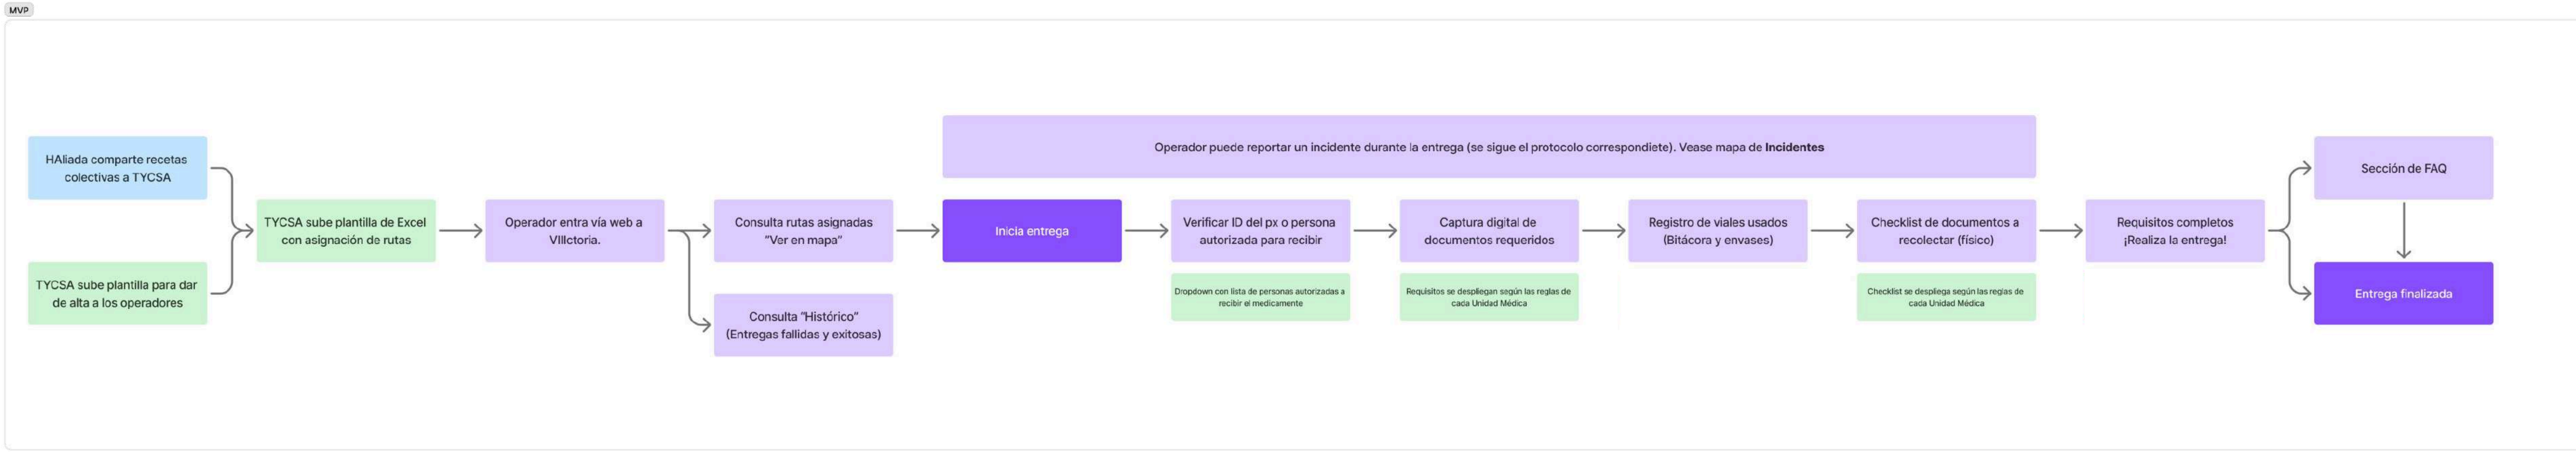
- Align features with real daily tasks.
- Define a full end-to-end journey.
- Spot gaps and edge cases early.
- Support fast and traceable deliveries.

Main MVP flow:

Public healthcare system (IMSS)

Route Coordinator

Last-mile operator



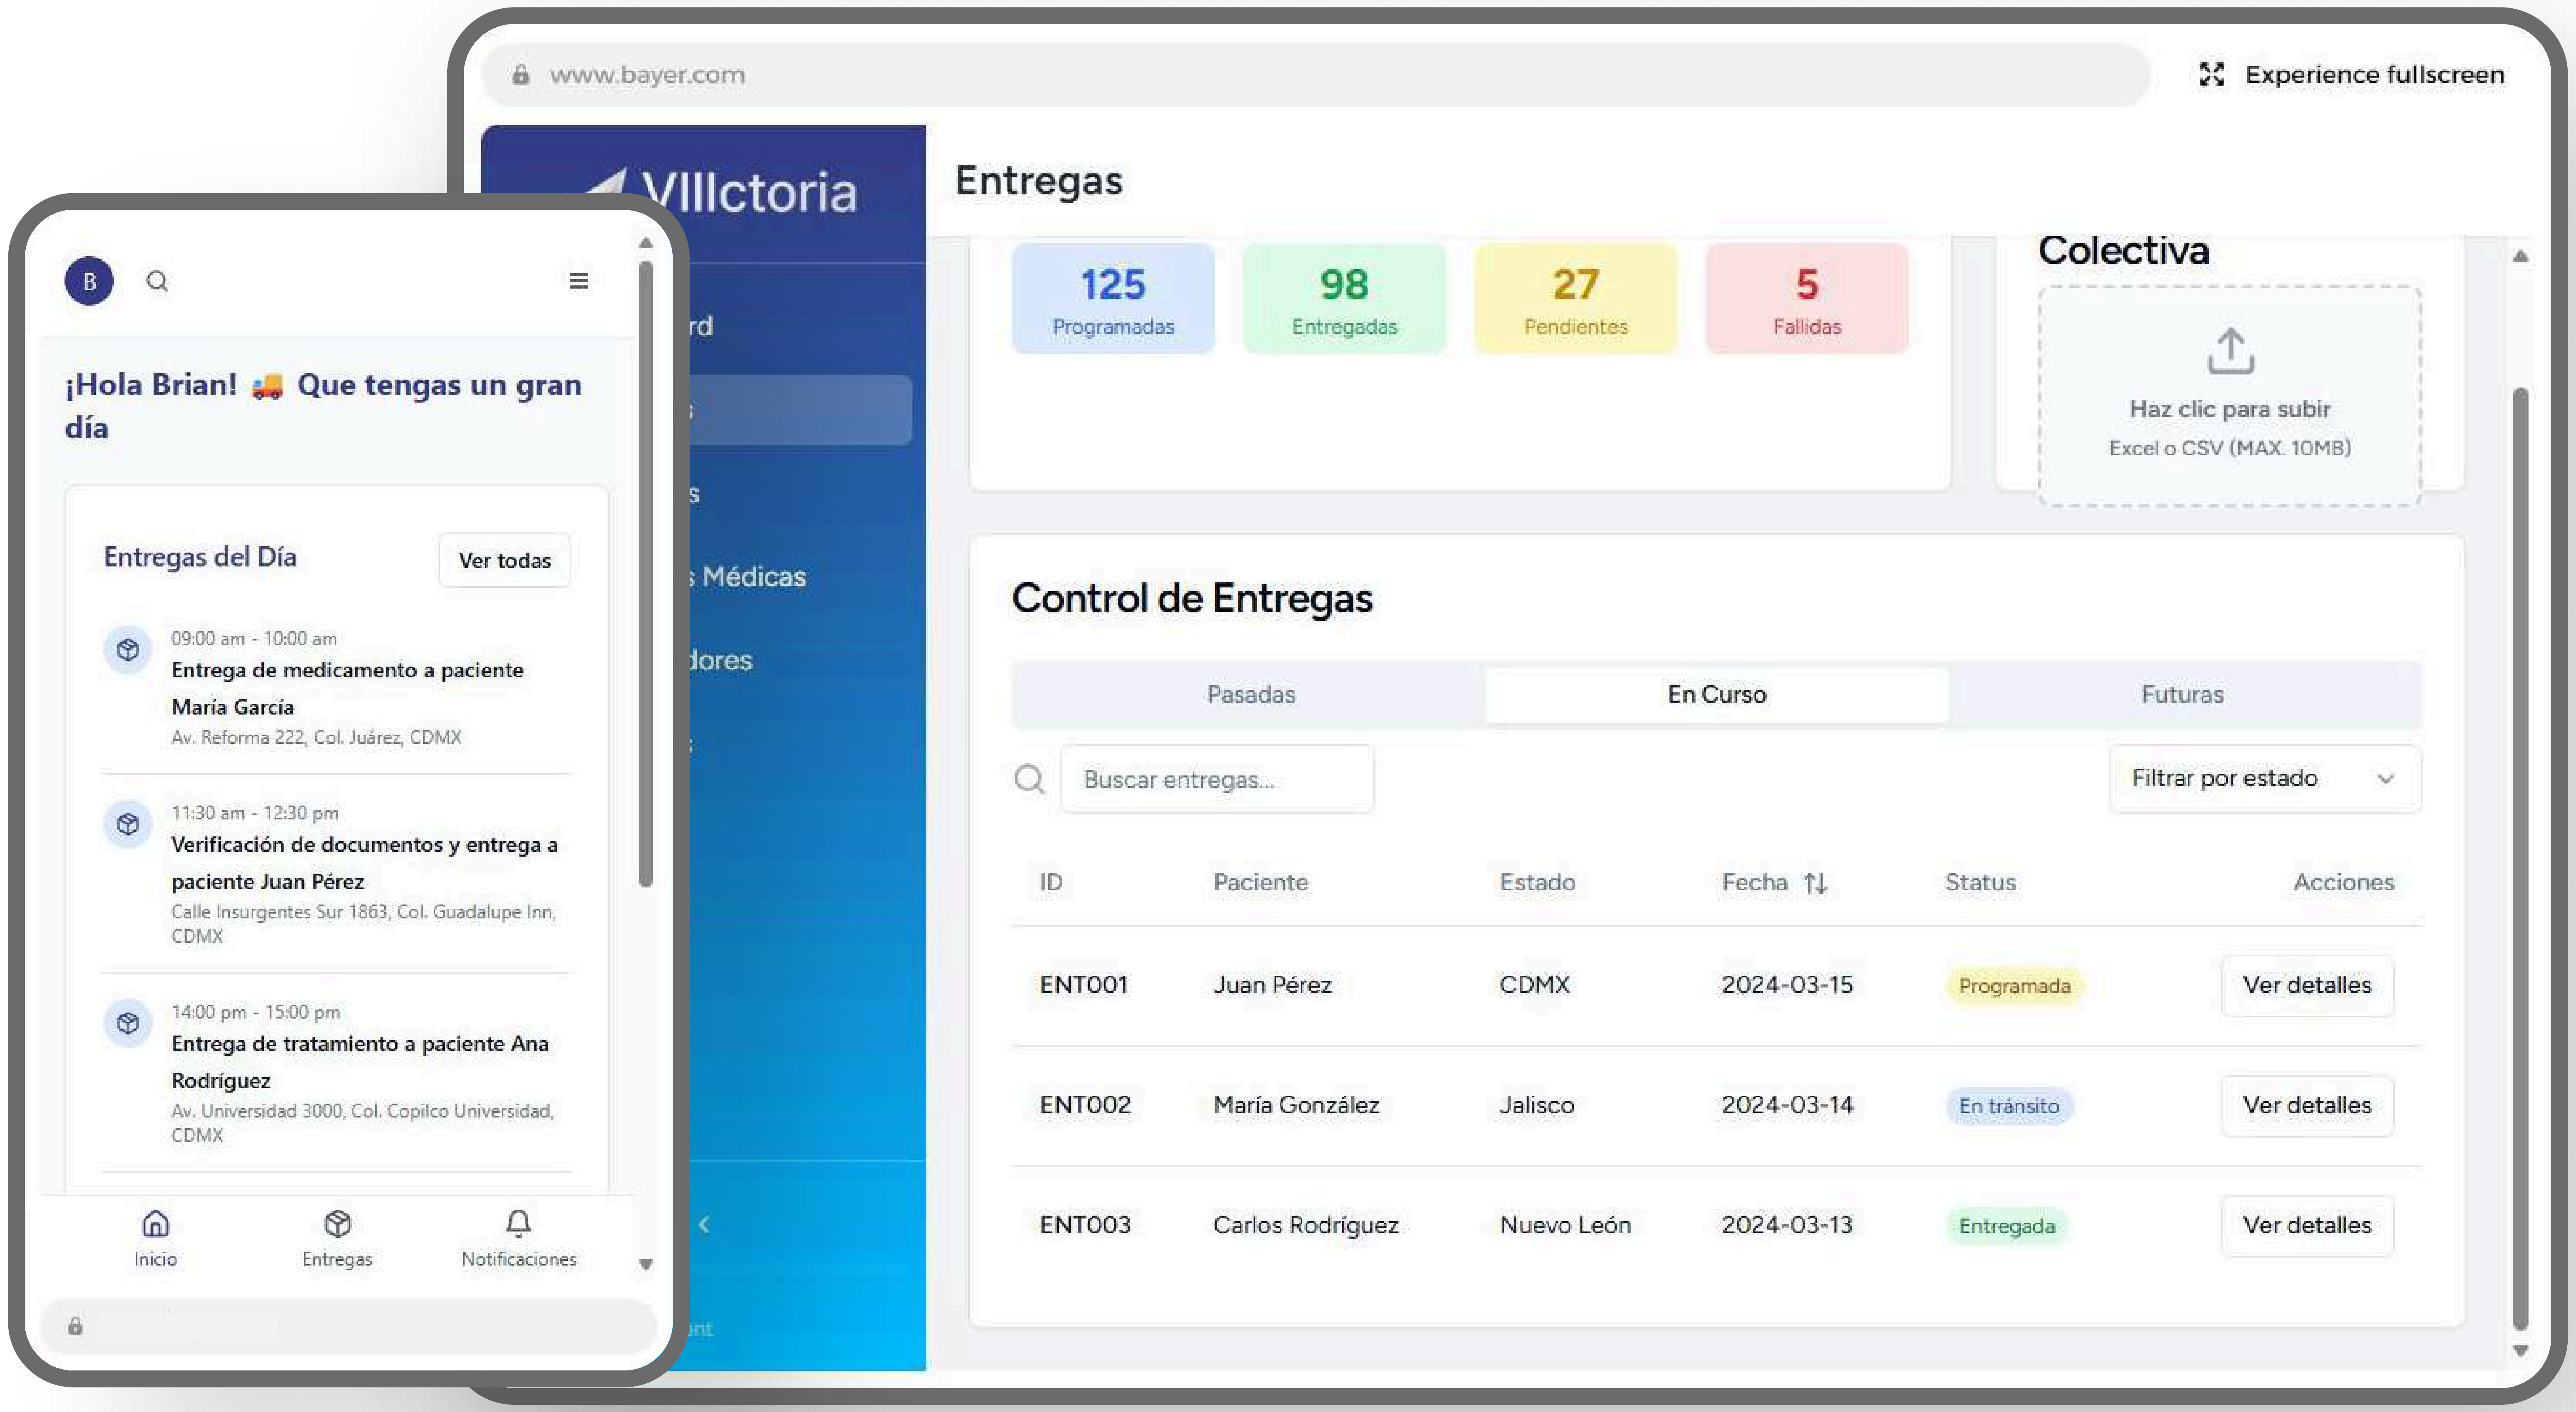
Case study

The design process

Prototype

Turning Needs into Actionable Flows

Before jumping into Figma, we built a quick proof of concept using an AI design tool (v0). This early version helped align stakeholders and validate initial flows.



Prototype

Design System Foundations

To ensure a cohesive experience across both desktop and mobile, we defined foundational tokens and UI guidelines — from typography and iconography to color and component behavior.

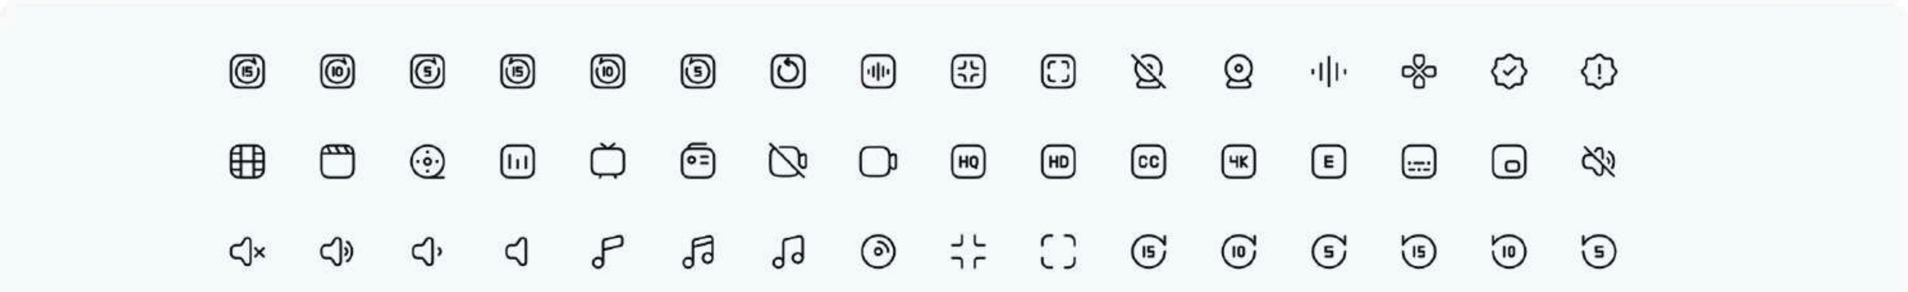
Iconography:

Alerts

Dynamic symbols conveying warnings, errors, or notifications to users with clarity and urgency.

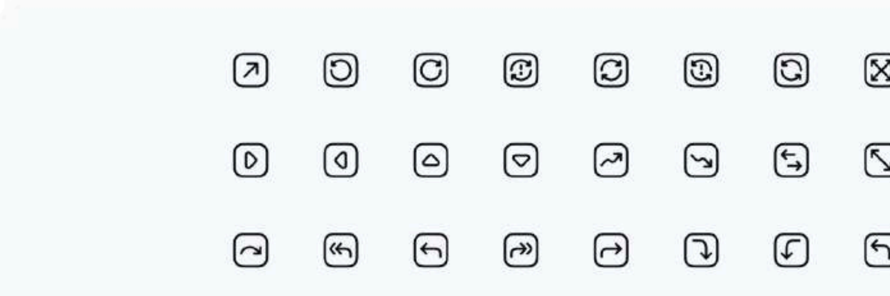
Audiovisual

Icons representing sound, video, and multimedia interactions for enhanced user engagement.



Arrows

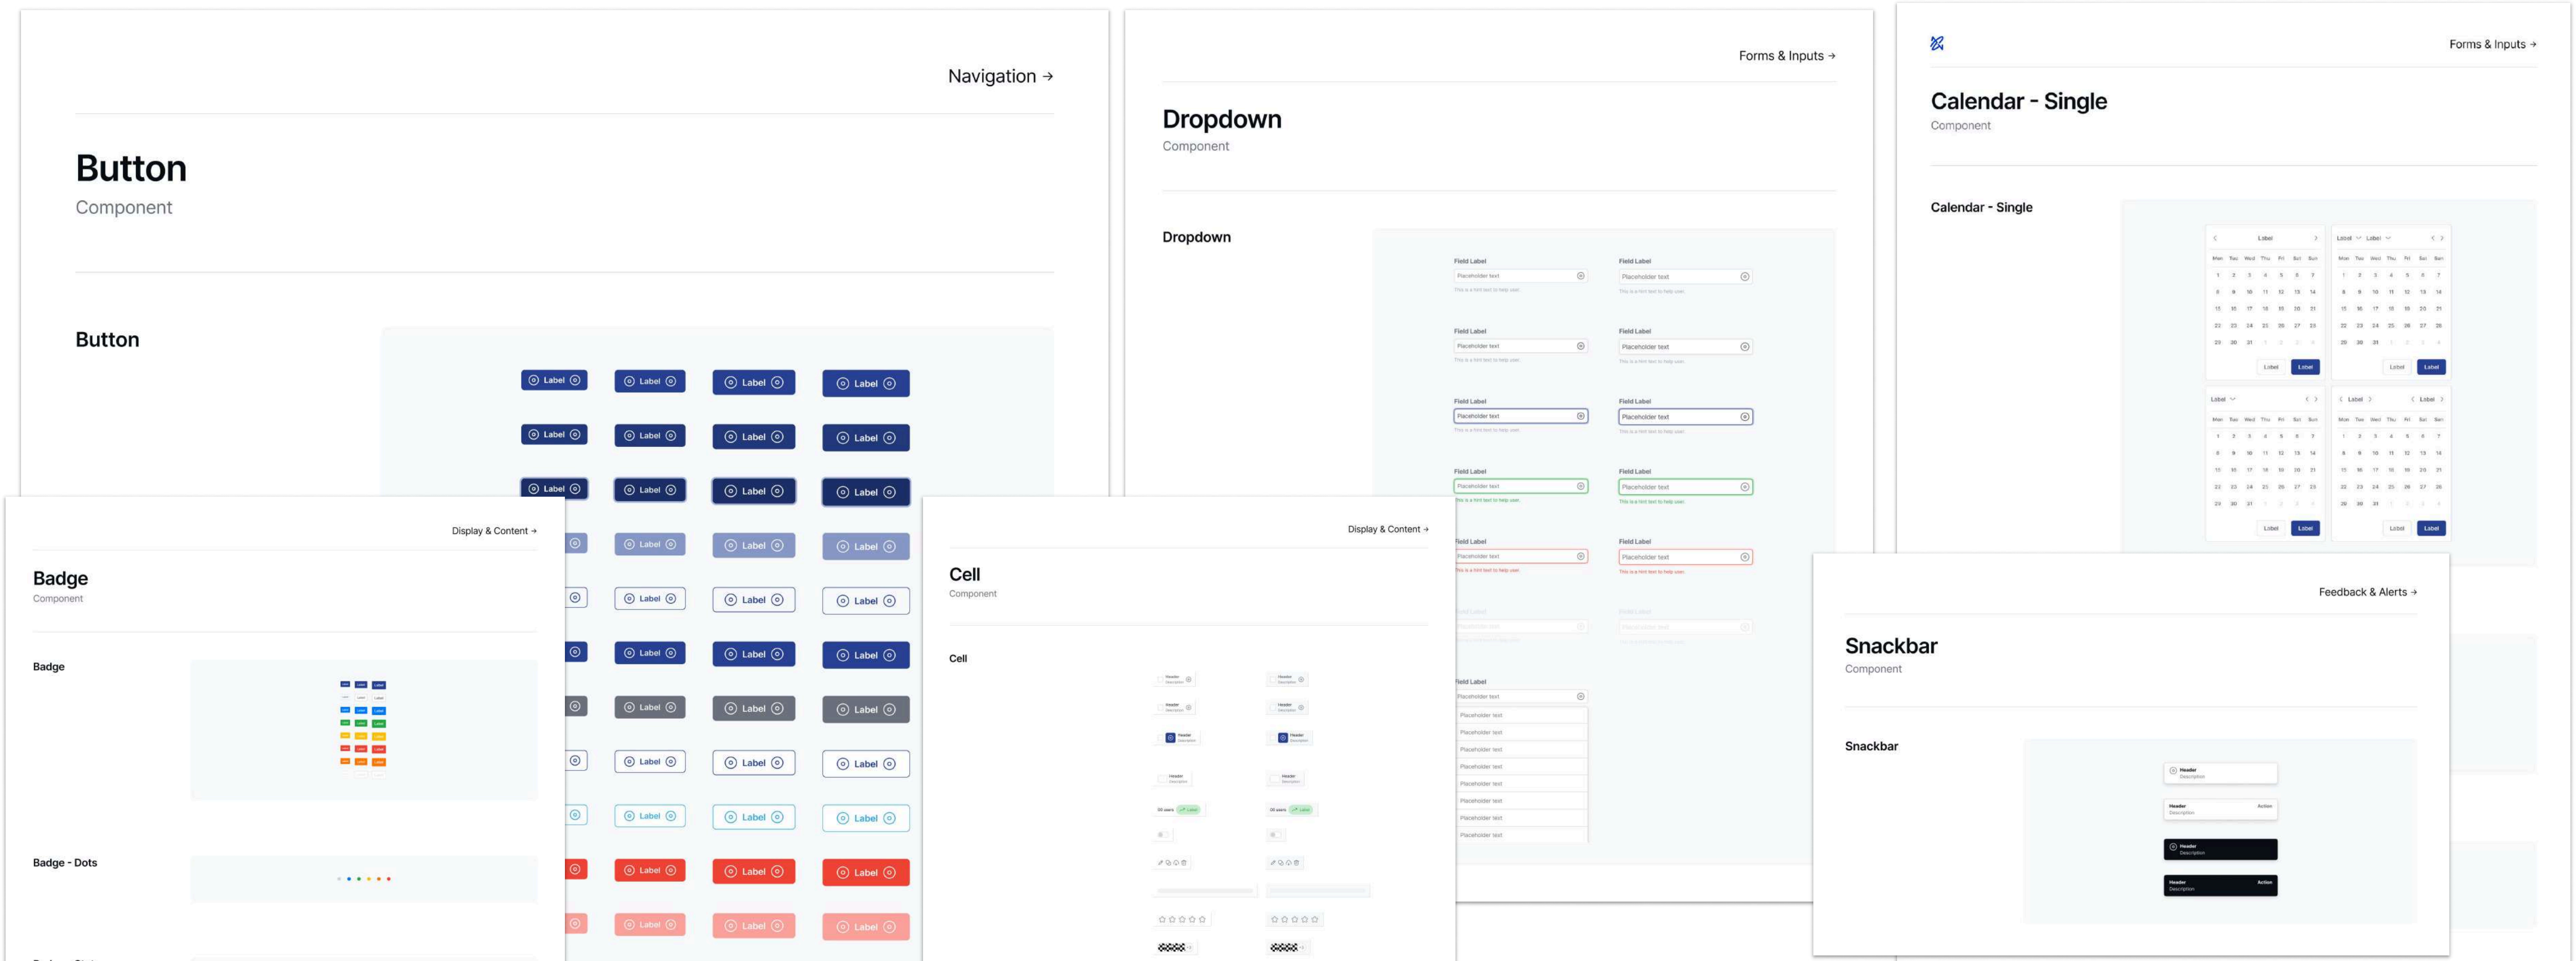
Directional symbols for navigation, indicating movement, and hierarchical relations.



Prototype & Test

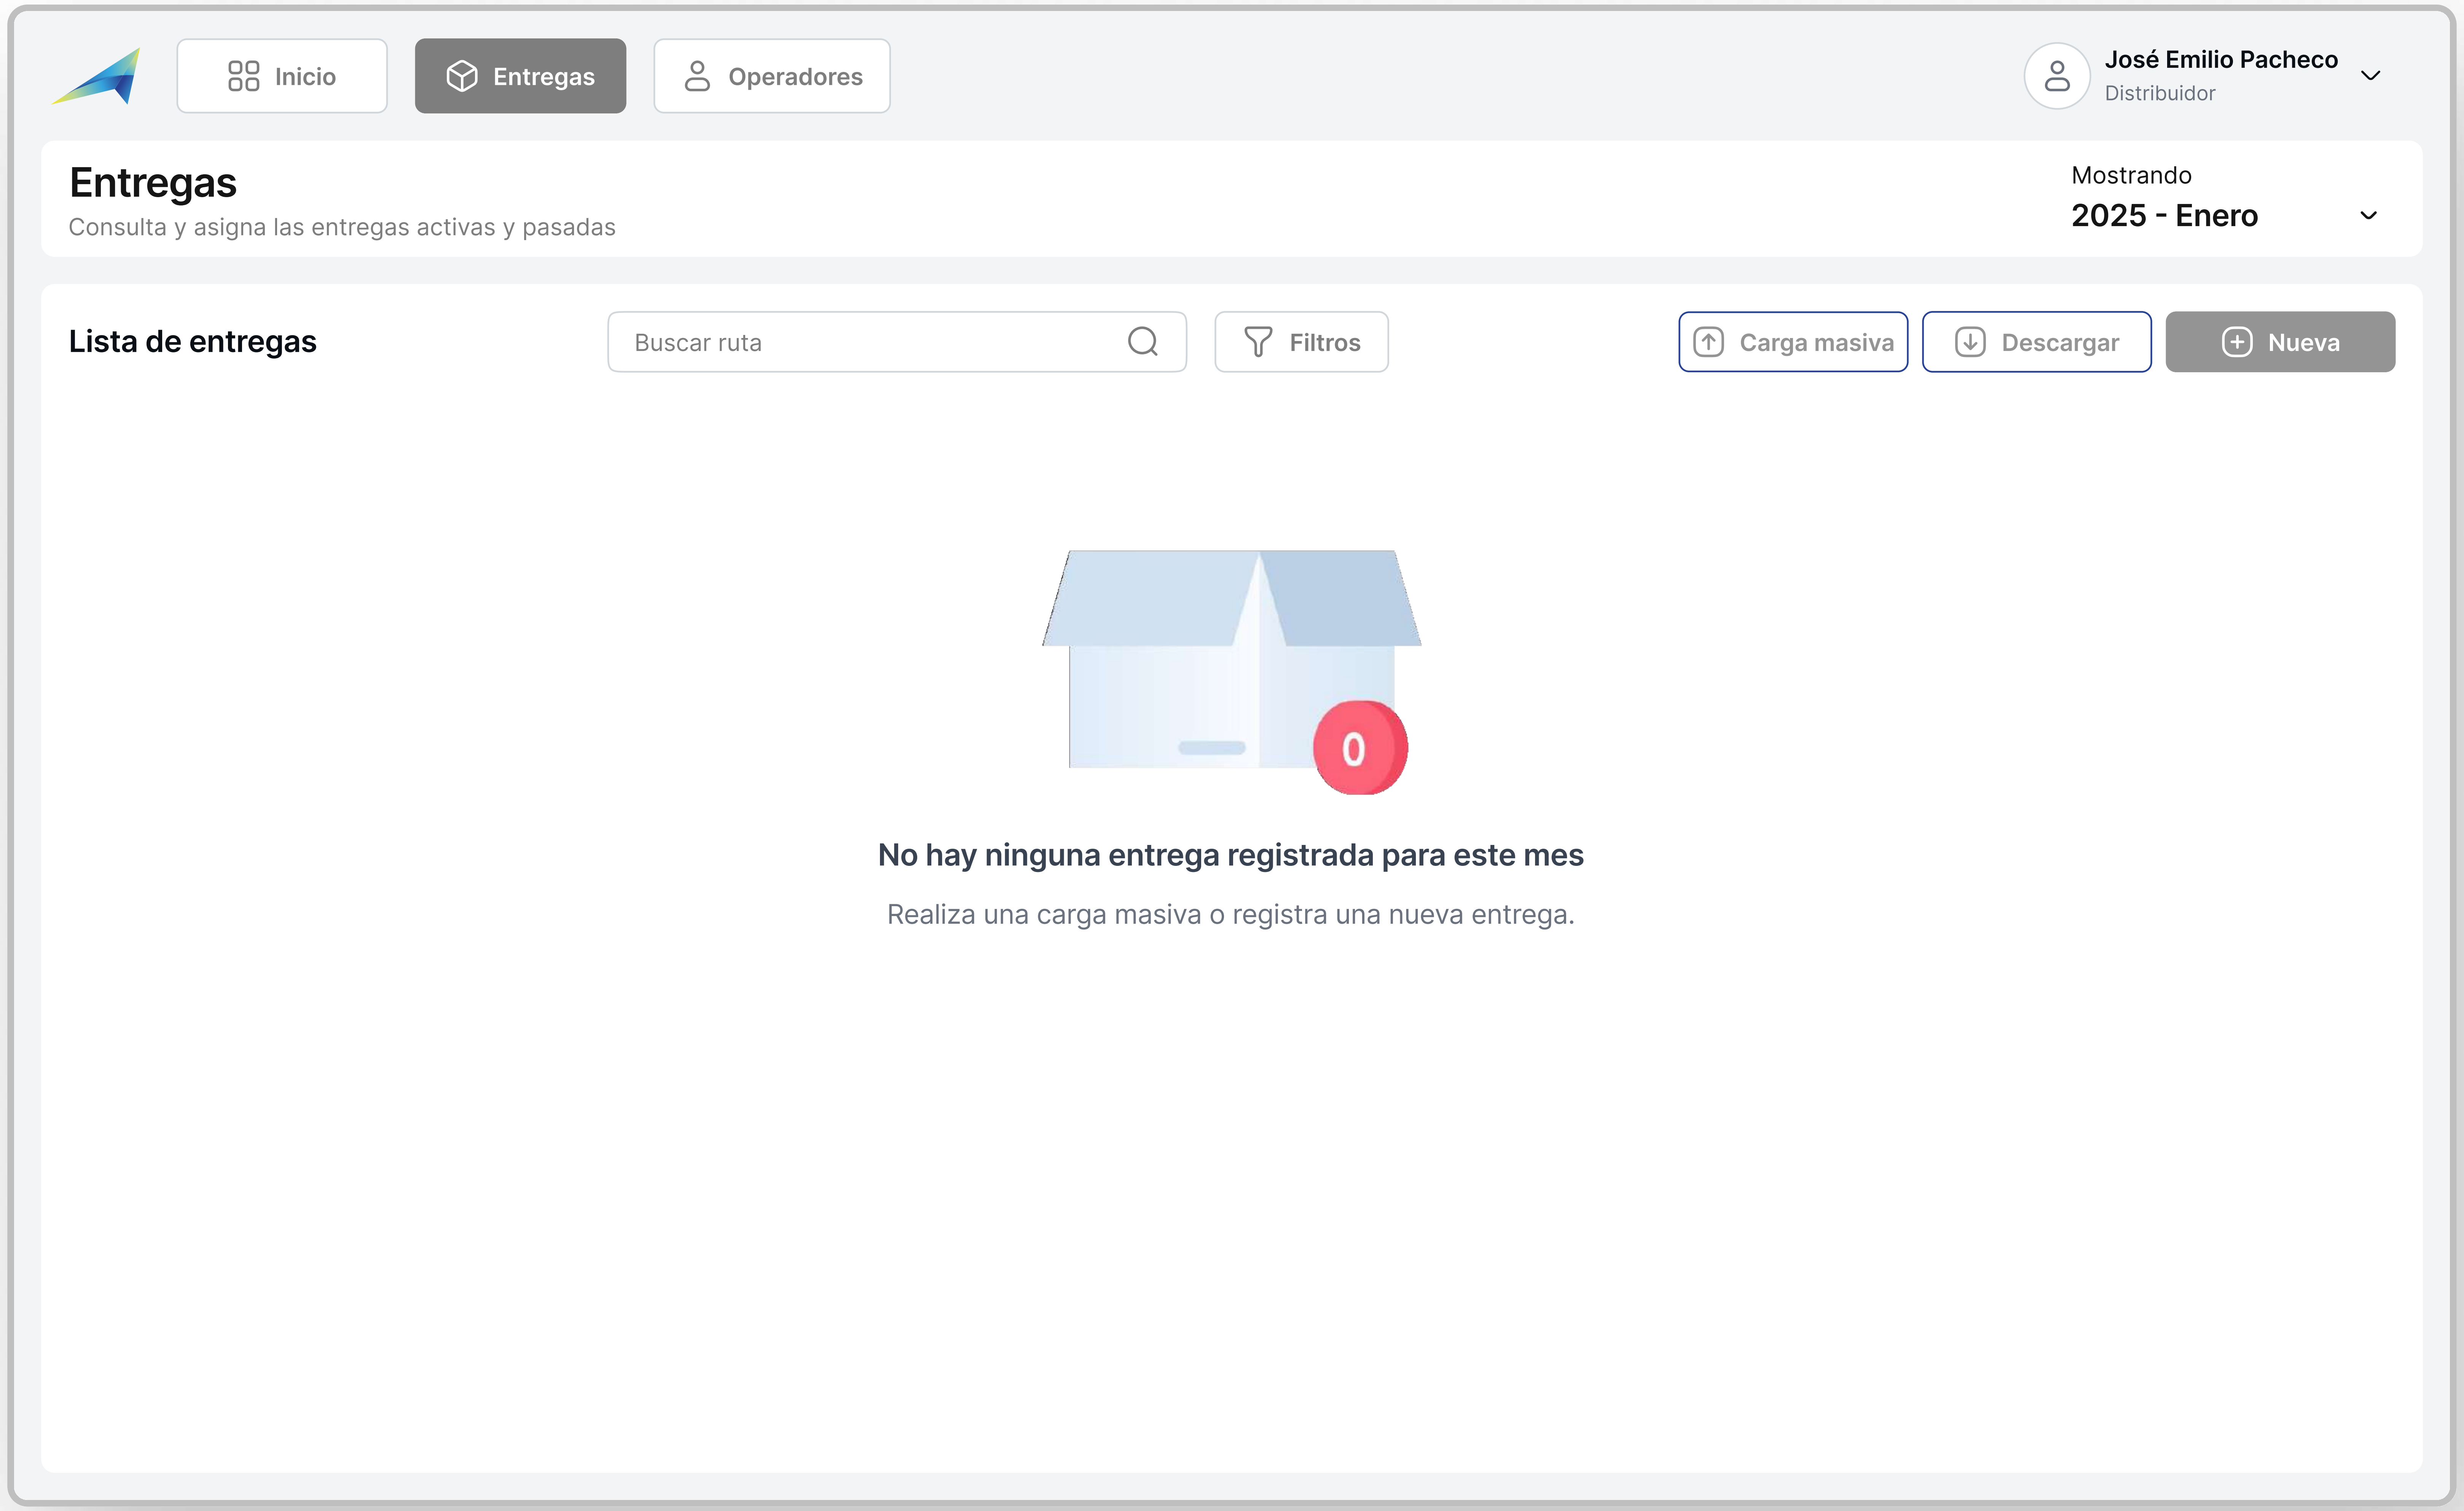
Component Library Overview

Our library of components helped streamline development and maintain consistency. Each element was built with accessibility, responsiveness, and dev handoff in mind.



Prototype & Test

Desktop Experience – Distributor Workflow



Prototype & Test

Mobile Experience – Operator Workflow

Assigned Deliveries Overview

Delivery Summary Before Starting

Iterate & Finalize

Polishing the Experience Through Iteration

We ran usability testing sessions with **5 last-mile operators** to validate the prototype and uncover friction points before launch.
Each session lasted **~25 minutes** and helped us assess clarity, flow, and real-world usability.

Key Iterations Based on Operator & Patient Feedback:

Clearer Language

Operators found some instructions confusing

Solution:

We updated in-app wording using simpler, field-friendly terms.

FAQ Support

Patients often asked about dosage or storage

Solution:

We added an FAQ screen with suggested responses.

Better Incident Reporting

Operators found some instructions confusing

Solution:

We added comments + direct nurse call option.

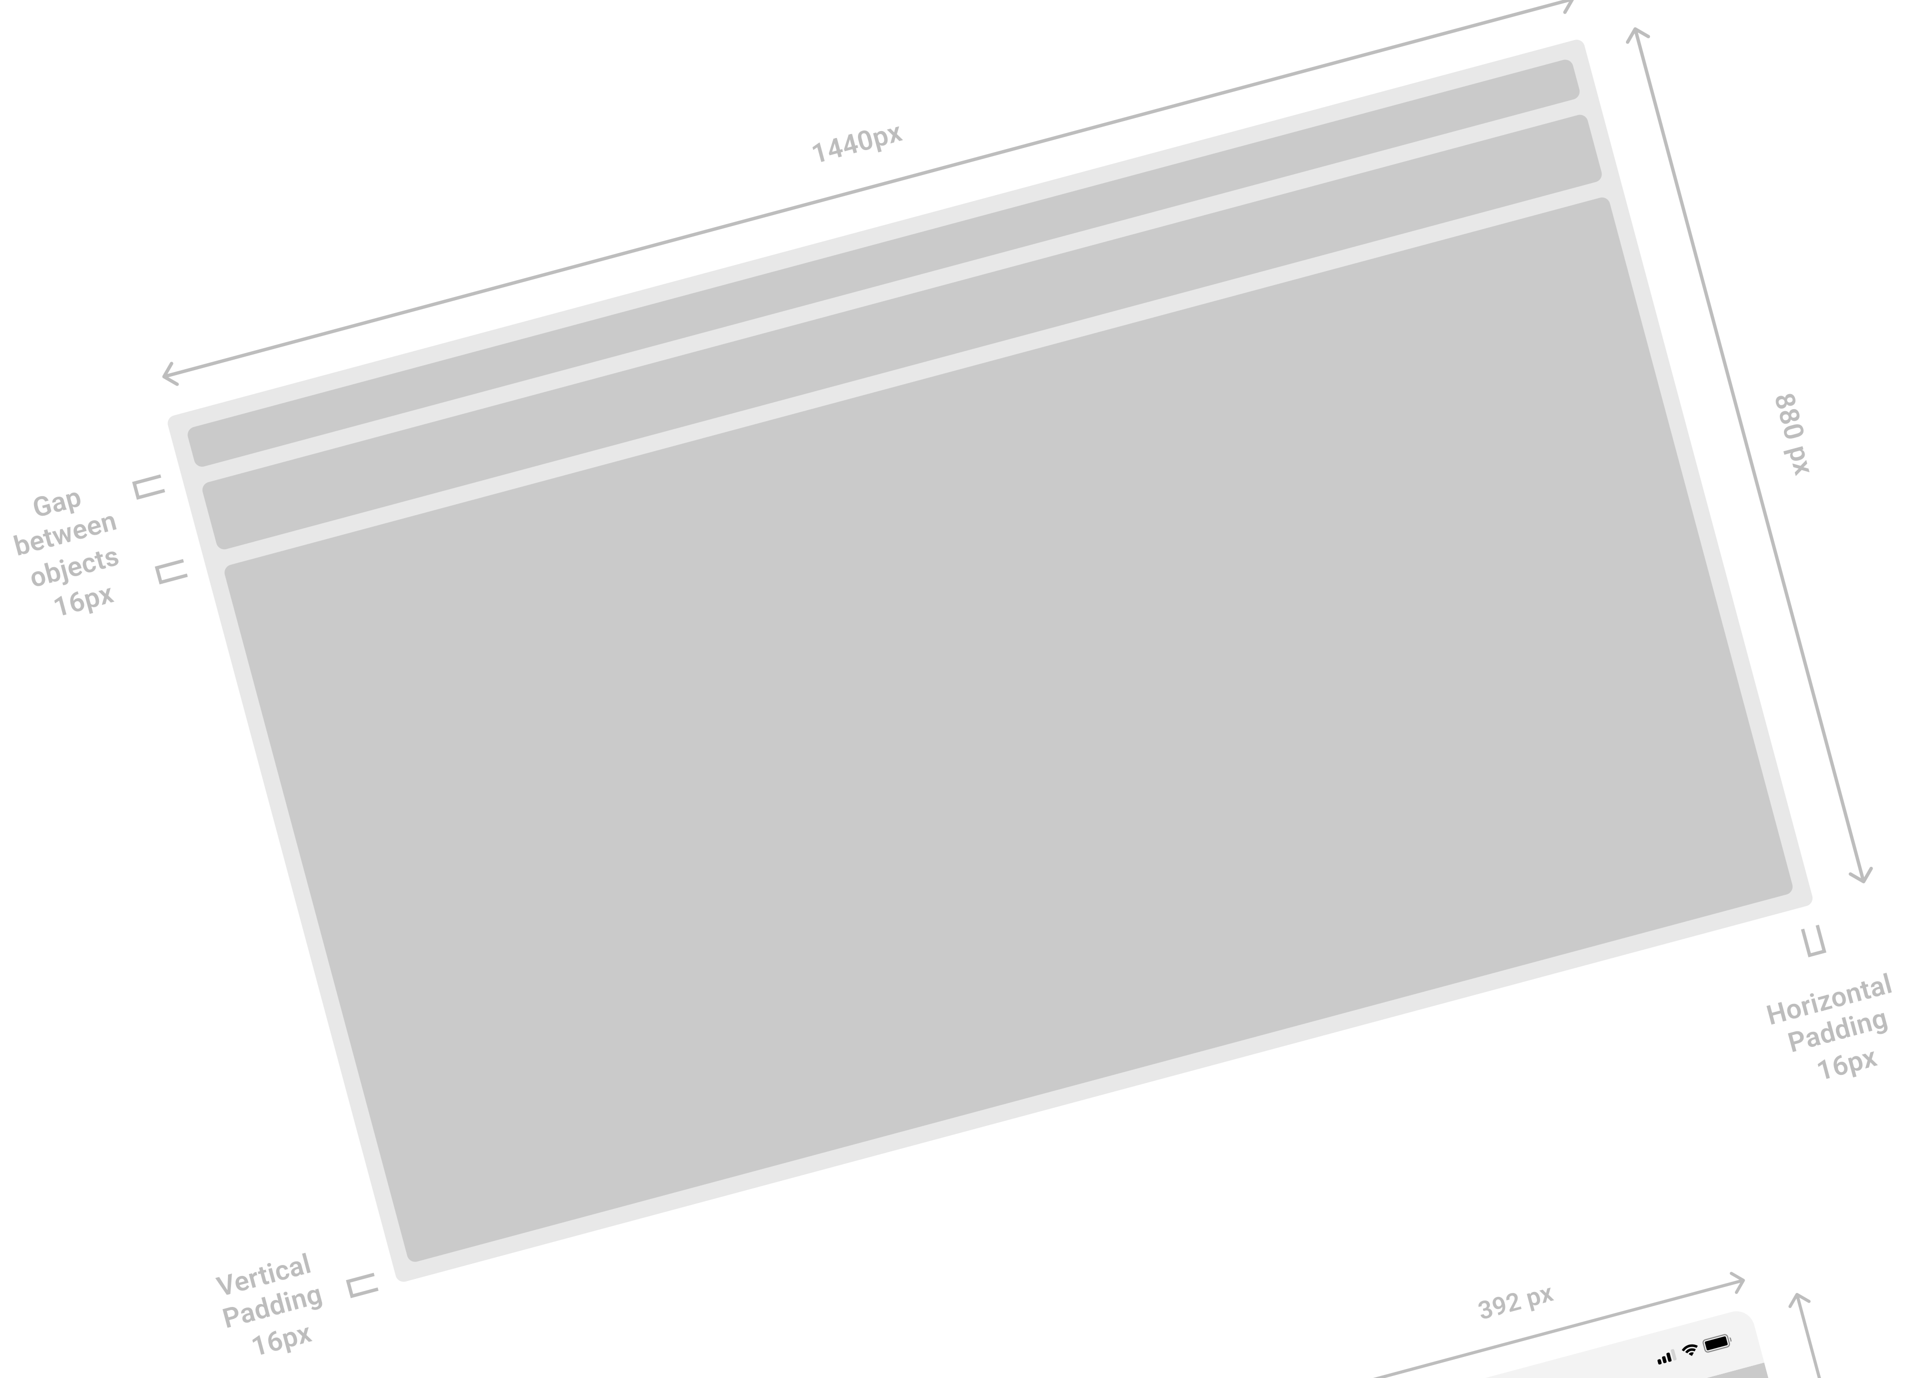
Test & Iterate

Handoff & Collaboration

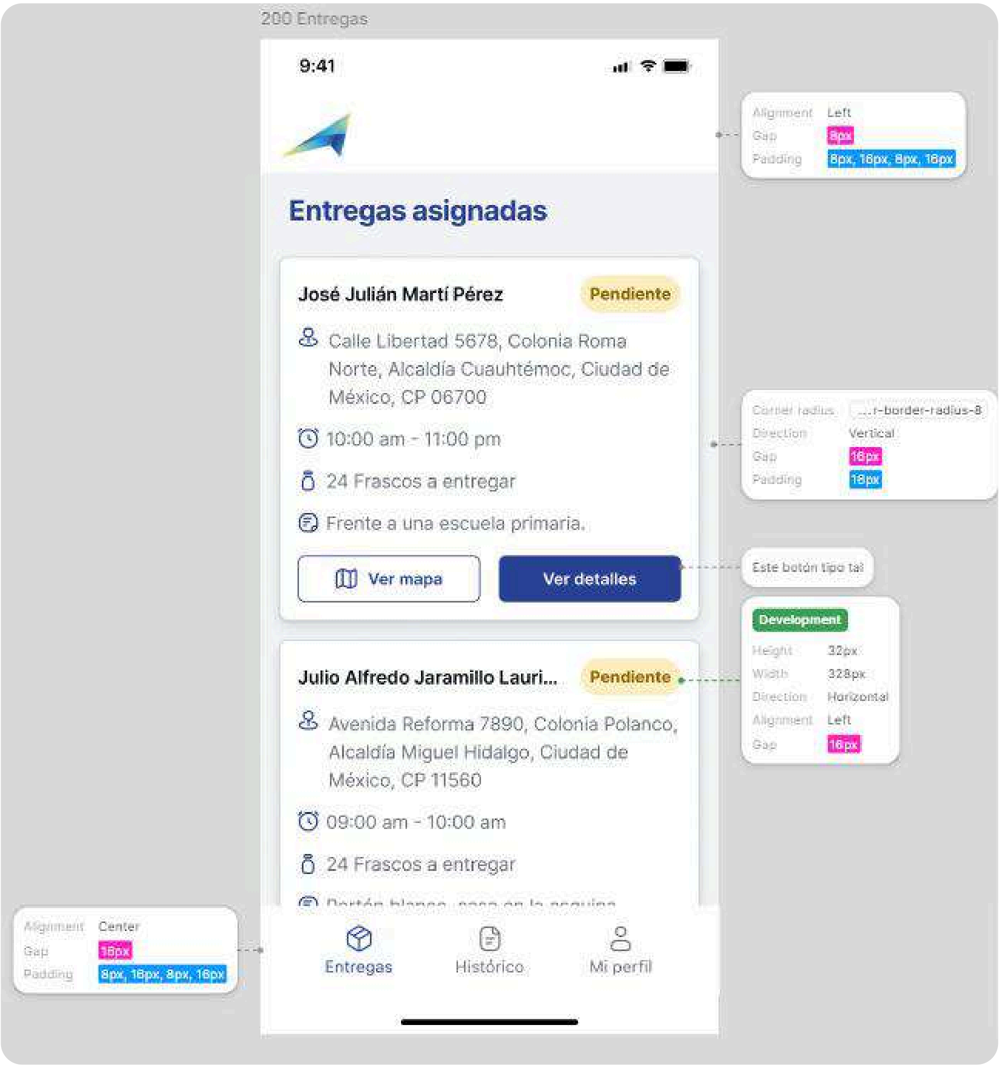
Handoff & Collaboration

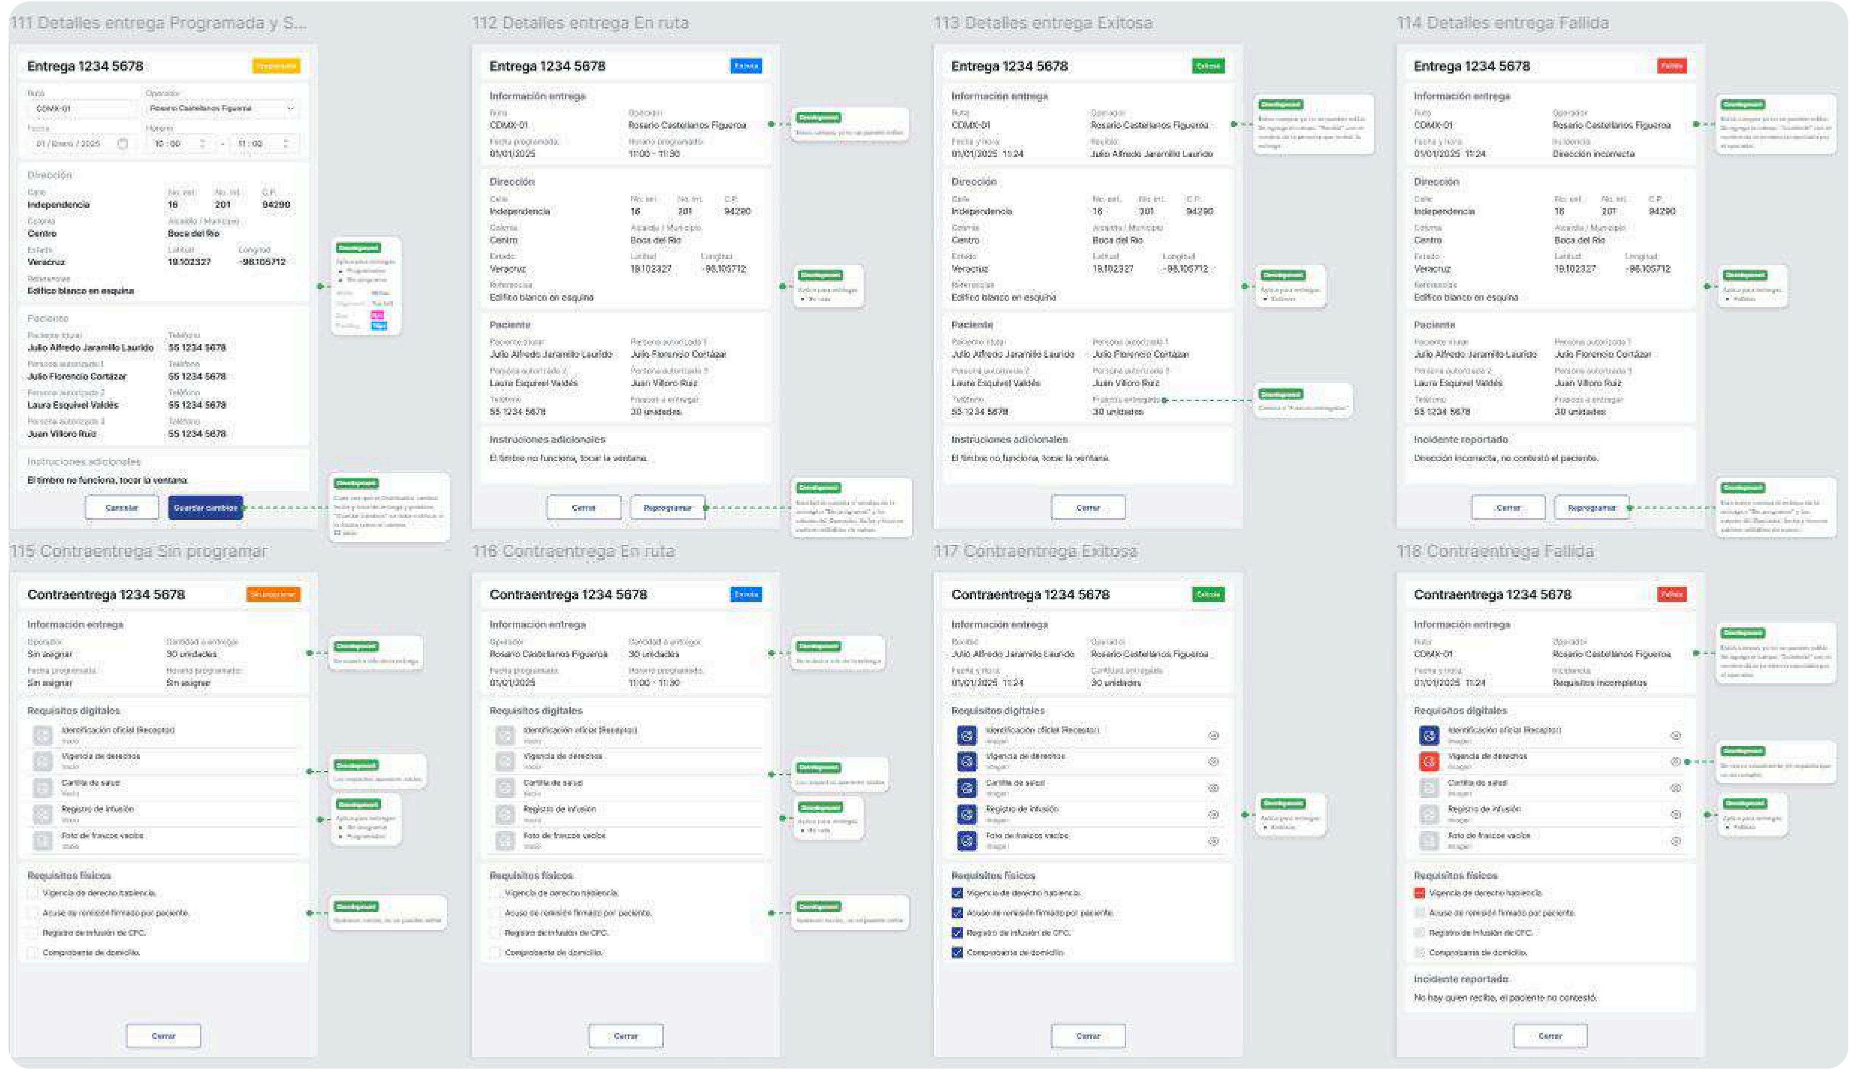
Design Handoff Toolkit

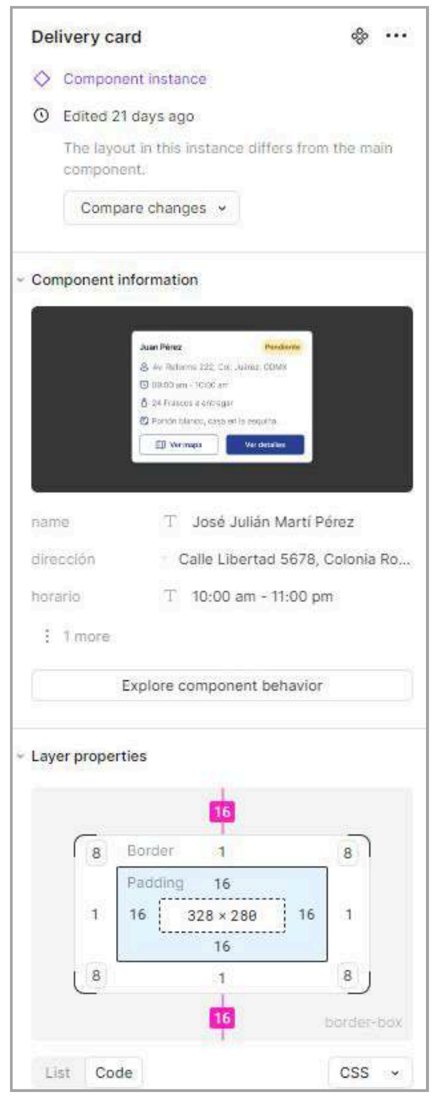


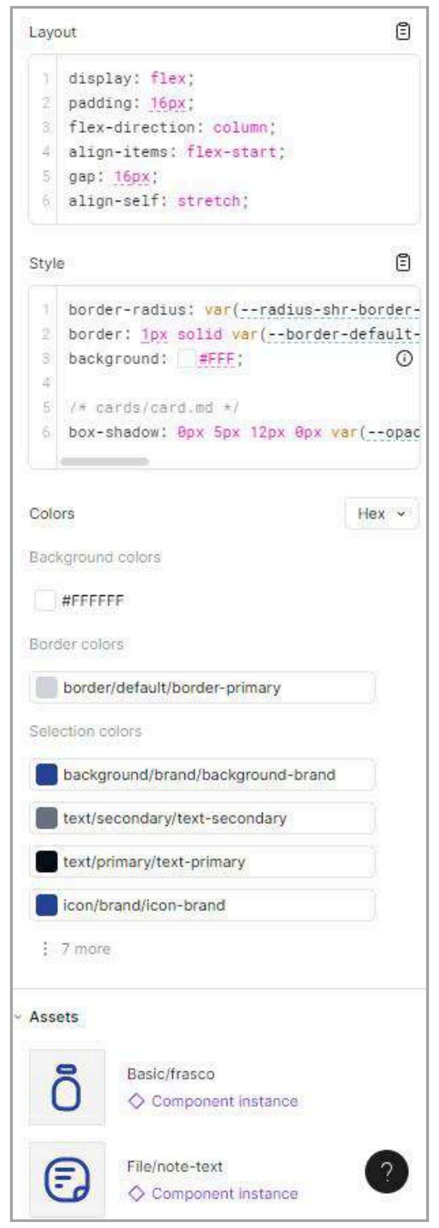
We delivered a fully documented UI system with specs, spacing, tokens, and component logic to support seamless implementation and reduce back-and-forth.

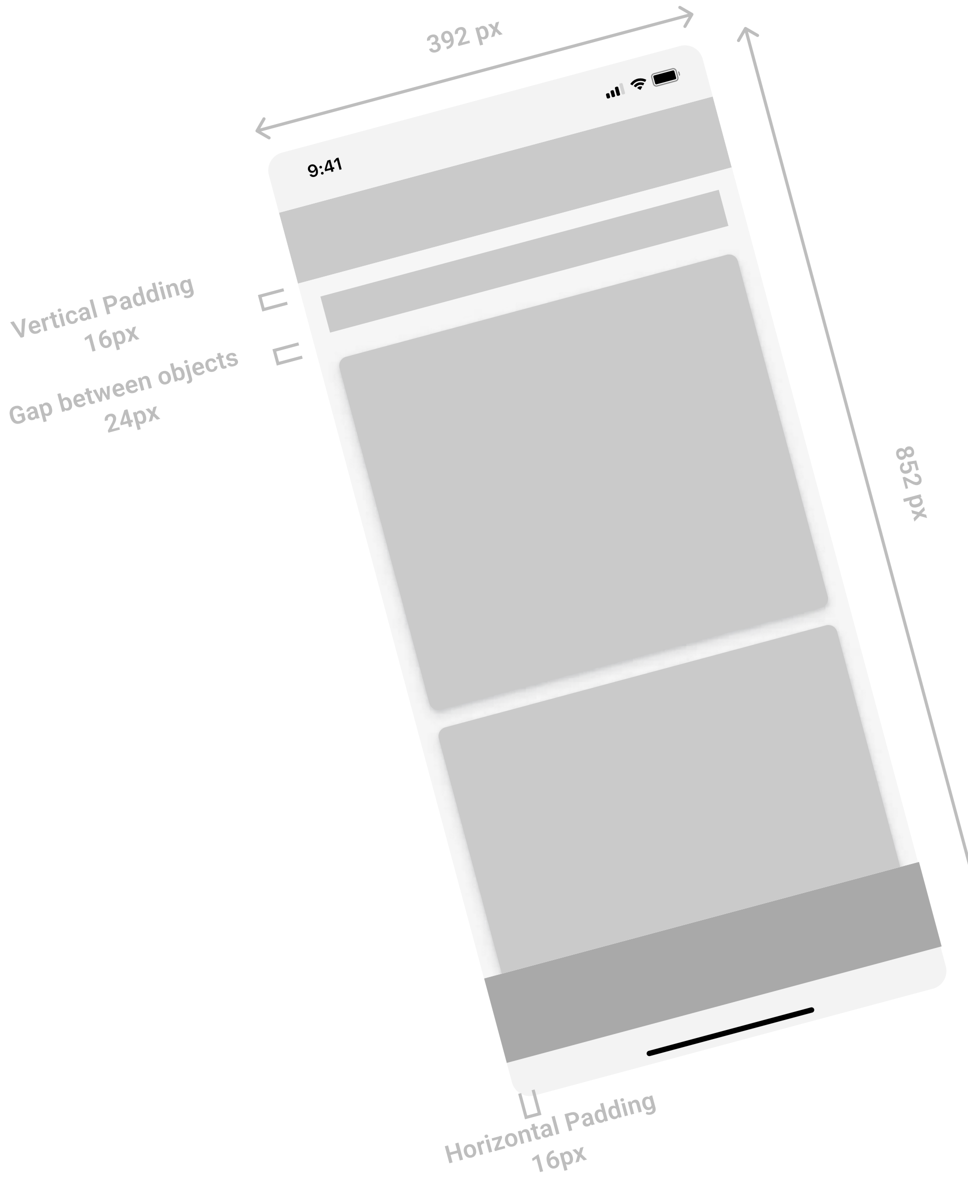
Design → Dev → QA











ALL SPECS, VARIANTS, AND EDGE CASES WERE ANNOTATED DIRECTLY IN FIGMA — MAKING IMPLEMENTATION EASIER AND MINIMIZING HANDOFF ERRORS.

Handoff & Collaboration

Adoption Support & Developer Sync

We stayed closely aligned with developers during implementation, clarified edge cases, and supported internal teams to ensure a smooth rollout and adoption.

- **Weekly syncs with dev team**
- **Clarified acceptance criteria**
- **Reviewed dev builds & provided feedback**
- **Created handover video / onboarding guide**

Impact Delivered

From design decisions to real-world results

90%

Deliveries now managed digitally via the new platform

70% less time

Spent assigning routes compared to the previous manual process

30 min

Average onboarding time for new operators

6

Critical usability issues resolved before dev

25+

UI components developed with full documentation

What I Didn't Do

Focusing first on the core delivery workflow

To ensure focus and fast validation, we deliberately excluded certain features from the MVP — prioritizing core workflows over peripheral roles or complex tech.

Offline Mode

Not essential for current routes, which operate mostly in areas with stable signal

GPS Location Tracking

Raised privacy concerns and wasn't a must-have for validating delivery at this stage

Admin / Nurse Dashboards

The goal was to first streamline and standardize deliveries before expanding roles

What's Next

From MVP to a scalable platform

As we move forward, the focus is on expanding functionality and refining the experience:

- **Expand the MVP to include admin and nurse dashboards**
- **Keep iterating based on real user feedback**
- **Strengthen the system for future roles and use cases**
